

Certified Ethical Hacker Class 3 of 3

One of our most popular certification courses! Stop hackers in their tracks by learning to think like one!

In just a few keystrokes, hackers can do millions of dollars worth of damage to an organization. Hacking goes beyond jeopardizing sensitive data and stealing financial information (as if that isn't bad enough). Hackers also erode consumer confidence and trust, cause major upheavals in internal corporate structure and cause untold damage to an organization's public image and persona.

In this course, candidates learn to get inside the hacker mindset and discover exactly how hackers use Trojans, backdoors, viruses and worms to hack into systems, how they successfully evade ID's, firewalls and other security measures, and how they use hijacking to gain access to web servers and sessions.

All students will leave this workshop with a detailed plan for conducting ongoing vulnerability assessments and penetration tests.

Who is this class for?

This course is designed for Computer Forensics Professionals, Incident Response Personnel, IT Security Professionals, IT Managers, Law Enforcement Personnel, System and Network Administrators and Architects.

What you will learn:

- Gain hands-on application by scanning, testing, hacking and securing your own systems
- Learn exactly how hackers escalate privileges and breach security systems
- Increase knowledge in Intrusion Detection, Policy Creation, Social Engineering, DDoS Attacks, Buffer Overflows and Virus Creation
- Design and practice developing a detailed plan for conducting ongoing vulnerability assessments and penetration tests
